# PROPERTIES OF REGULAR LANGUAGES

IF 2124 TEORI BAHASA FORMAL OTOMATA

Judhi S.

Properties of Regular Languages

- *Pumping Lemma.* Every regular language satisfies the pumping lemma. If somebody presents you with fake regular language, use the pumping lemma to show a contradiction.

- *Closure properties.* Building automata from components through operations, e.g. given L and M we can build an automaton for $L \cap M$.

- *Decision properties.* Computational analysis of automata, e.g. are two automata equivalent.

- *Minimization techniques.* We can save money since we can build smaller machines.

The Pumping Lemma Informally

Suppose $L_{01} = \{0^n 1^n : n \geq 1\}$ were regular.

Then it would be recognized by some DFA A, with, say, k states.

Let A read 0^k. On the way it will travel as follows:

$$
\begin{array}{cc}
\epsilon & p_0 \\
0 & p_1 \\
00 & p_2 \\
\ldots & \ldots \\
0^k & p_k
\end{array}
$$

$\Rightarrow \exists i < j : p_i = p_j$ Call this state q.

Now you can fool A:

If $\widehat{\delta}(q, 1^i) \in F$ the machine will foolishly ac-
cept $0^j 1^i$.

If $\widehat{\delta}(q, 1^i) \notin F$ the machine will foolishly re-
ject $0^i 1^i$.

Therefore L_{01} cannot be regular.

• Let's generalize the above reasoning.

Theorem 4.1.

The Pumping Lemma for Regular Languages.

Let L be regular.

Then $\exists n, \forall w \in L : |w| \geq n \Rightarrow w = xyz$ such that

1. $y \neq \epsilon$

2. $|xy| \leq n$

3. $\forall k \geq 0,\ xy^k z \in L$

Proof: Suppose L is regular

The L is recognized by some DFA A with, say, n states.

Let $w = a_1 a_2 \ldots a_m \in L$, $m > n$.
Let $p_i = \hat{\delta}(q_0, a_1 a_2 \cdots a_i)$.

$\Rightarrow \exists i < j : p_i = p_j$

Now $w = xyz$, where

1. $x = a_1 a_2 \cdots a_i$

2. $y = a_{i+1} a_{i+2} \cdots a_j$

3. $z = a_{j+1} a_{j+2} \cdots a_m$

Evidently $xy^k z \in L$, for any $k \geq 0$. $Q.E.D.$

Example: Let L_{eq} be the language of strings with equal number of zero's and one's.

Suppose L_{eq} is regular. Then $w = 0^n 1^n \in L$.

By the pumping lemma $w = xyz$, $|xy| \leq n$, $y \neq \epsilon$ and $xy^k z \in L_{eq}$

$$w = \underbrace{000 \cdots}_{x} \underbrace{\cdots 0}_{y} \underbrace{0\, 0111 \cdots 11}_{z}$$

In particular, $xz \in L_{eq}$, but xz has fewer 0's than 1's.

Suppose $L_{pr} = \{1^p : p \text{ is prime }\}$ were regular.

Let n be given by the pumping lemma.

Choose a prime $p \geq n + 2$.

$$w = \overbrace{\underbrace{111 \cdots \cdots 1}_{x} \underbrace{1111 \cdots 11}_{\substack{z}}}^{p}$$
$$\underbrace{}_{\substack{y \\ |y|=m}}$$

Now $xy^{p-m}z \in L_{pr}$

$|xy^{p-m}z| = |xz| + (p - m)|y| =$
$p - m + (p - m)m = (1 + m)(p - m)$
which is not prime unless one of the factors
is 1.

- $y \neq \epsilon \Rightarrow 1 + m > 1$

- $m = |y| \leq |xy| \leq n, \ \ p \geq n + 2$
$\Rightarrow p - m \geq n + 2 - n = 2.$

Closure Properties of Regular Languages

Let L and M be regular languages. Then the following languages are all regular:

- *Union: $L \cup M$*

- *Intersection: $L \cap M$*

- *Complement: $\overline{N}$*

- *Difference: $L \setminus M$*

- *Reversal: $L^R = \{w^R : w \in L\}$*

- *Closure: L^*.*

- *Concatenation: $L.M$*

- *Homomorphism:*
$h(L) = \{h(w) : w \in L, h$ is a homom. $\}$

- *Inverse homomorphism:*
$h^{-1}(L) = \{w \in \Sigma : h(w) \in L, h : \Sigma \to \Delta$ is a homom. $\}$

Theorem 4.4. For any regular L and M, $L \cup M$ is regular.

Proof. Let $L = L(E)$ and $M = L(F)$. Then $L(E + F) = L \cup M$ by definition.

**Theorem 4.5.** If L is a regular language over Σ, then so is $\overline{L} = \Sigma^* \setminus L$.

Proof. Let L be recognized by a DFA

$$A = (Q, \Sigma, \delta, q_0, F).$$

Let $B = (Q, \Sigma, \delta, q_0, Q \setminus F)$. Now $L(B) = \overline{L}$.

Example:

Let L be recognized by the DFA below

Then $\overline{L}$ is recognized by

Question: What are the regex's for L and $\overline{L}$

Theorem 4.8. If L and M are regular, then so is $L \cap M$.

Proof. By DeMorgan's law $L \cap M = \overline{\overline{L} \cup \overline{M}}$. We already that regular languages are closed under complement and union.

We shall shall also give a nice direct proof, the *Cartesian* construction from the e-commerce example.

Theorem 4.8. If L and M are regular, then so in $L \cap M$.

Proof. Let L be the language of

$$A_L = (Q_L, \Sigma, \delta_L, q_L, F_L)$$

and M be the language of

$$A_M = (Q_M, \Sigma, \delta_M, q_M, F_M)$$

We assume w.l.o.g. that both automata are deterministic.

We shall construct an automaton that simulates A_L and A_M in parallel, and accepts if and only if both A_L and A_M accept.

If A_L goes from state p to state s on reading a, and A_M goes from state q to state t on reading a, then $A_{L \cap M}$ will go from state (p, q) to state (s, t) on reading a.

Formally

$$A_{L \cap M} = (Q_L \times Q_M, \Sigma, \delta_{L \cap M}, (q_L, q_M), F_L \times F_M),$$

where

$$\delta_{L \cap M}((p,q), a) = (\delta_L(p,a), \delta_M(q,a))$$

It will be shown in the tutorial by and induction on $|w|$ that

$$\hat{\delta}_{L \cap M}((q_L, q_M), w) = \left(\hat{\delta}_L(q_L, w), \hat{\delta}_M(q_M, w) \right)$$

The claim then follows.

Question: Why?

Example: $(c) = (a) \times (b)$

(a)

(b)

(c)

104

Theorem 4.10. If L and M are regular languages, then so in $L \setminus M$.

Proof. Observe that $L \setminus M = L \cap \overline{M}$. We already know that regular languages are closed under complement and intersection.

Theorem 4.11. If L is a regular language, then so is L^R.

Proof 1: Let L be recognized by an FA A. Turn A into an FA for L^R, by

1. Reversing all arcs.

2. Make the old start state the new sole accepting state.

3. Create a new start state p_0, with $\delta(p_0, \epsilon) = F$ (the old accepting states).

Theorem 4.11. If L is a regular language, then so is L^R.

Proof 2: Let L be described by a regex E. We shall construct a regex E^R, such that $L(E^R) = (L(E))^R$.

We proceed by a structural induction on E.

Basis: If E is ϵ, $\emptyset$, or a, then $E^R = E$.

Induction:

1. $E = F + G$. Then $E^R = F^R + G^R$

2. $E = F.G$. Then $E^R = G^R.F^R$

3. $E = F^*$. Then $E^R = (F^R)^*$

We will show by structural induction on E on blackboard in class that

$$L(E^R) = (L(E))^R$$

Homomorphisms

A *homomorphism* on Σ is a function $h : \Sigma^* \to \Theta^*$, where Σ and Θ are alphabets.

Let $w = a_1 a_2 \cdots a_n \in \Sigma^*$. Then

$$h(w) = h(a_1)h(a_2) \cdots h(a_n)$$

and

$$h(L) = \{h(w) : w \in L\}$$

Example: Let $h : \{0, 1\}^* \to \{a, b\}^*$ be defined by $h(0) = ab$, and $h(1) = \epsilon$. Now $h(0011) = abab$.

Example: $h(L(\mathbf{10^*1})) = L((\mathbf{ab})^*)$.

Theorem 4.14: $h(L)$ is regular, whenever L is.

Proof:

Let $L = L(E)$ for a regex E. We claim that $L(h(E)) = h(L)$.

Basis: If E is ϵ or $\emptyset$. Then $h(E) = E$, and $L(h(E)) = L(E) = h(L(E))$.

If E is a, then $L(E) = \{a\}$, $L(h(E)) = L(h(a)) = \{h(a)\} = h(L(E))$.

Induction:

Case 1: $L = E + F$. Now $L(h(E + F)) = L(h(E) + h(F)) = L(h(E)) \cup L(h(F)) = h(L(E)) \cup h(L(F)) = h(L(E) \cup L(F)) = h(L(E + F))$.
Case 2: $L = E.F$. Now $L(h(E.F)) = L(h(E)).L(h(F)) = h(L(E)).h(L(F)) = h(L(E).L(F))$

*Case 3:* $L = E^*$. Now $L(h(E^*)) = L(h(E)^*) = L(h(E))^* = h(L(E))^* = h(L(E^*))$.

Inverse Homomorphism

Let $h : \Sigma^* \to \Theta^*$ be a homom. Let $L \subseteq \Theta^*$, and define

$$h^{-1}(L) = \{w \in \Sigma^* : h(w) \in L\}$$

(a)

(b)

Example: Let $h : \{a, b\} \rightarrow \{0, 1\}^*$ be defined by $h(a) = 01$, and $h(b) = 10$. If $L = L((00 + 1)^*)$, then $h^{-1}(L) = L((\boldsymbol{ba})^*)$.

Claim: $h(w) \in L$ if and only if $w = (ba)^n$

Proof: Let $w = (ba)^n$. Then $h(w) = (1001)^n \in L$.

Let $h(w) \in L$, and suppose $w \notin L((\boldsymbol{ba})^*)$. There are four cases to consider.
1. w begins with a. Then $h(w)$ begins with 01 and $\notin L((00 + 1)^*)$.

2. w ends in b. Then $h(w)$ ends in 10 and $\notin L((00 + 1)^*)$.

3. $w = xaay$. Then $h(w) = z0101v$ and $\notin L((00 + 1)^*)$.

4. $w = xbby$. Then $h(w) = z1010v$ and $\notin L((00 + 1)^*)$.

Theorem 4.16: Let $h : \Sigma^* \rightarrow \Theta^*$ be a homom., and $L \subseteq \Theta^*$ regular. Then $h^{-1}(L)$ is regular.

Proof: Let L be the language of $A = (Q, \Theta, \delta, q_0, F)$. We define $B = (Q, \Sigma, \gamma, q_0, F)$, where

$$\gamma(q, a) = \widehat{\delta}(q, h(a))$$

It will be shown by induction on $|w|$ in the tutorial that $\widehat{\gamma}(q_0, w) = \widehat{\delta}(q_0, h(w))$

Decision Properties

We consider the following:

1. Converting among representations for regular languages.

2. Is $L = \emptyset$?

3. Is $w \in L$?

4. Do two descriptions define the same language?

From NFA's to DFA's

Suppose the ϵ-NFA has n states.

To compute ECLOSE(p) we follow at most n^2 arcs.

The DFA has 2^n states, for each state S and each $a \in \Sigma$ we compute $\delta_D(S, a)$ in n^3 steps. Grand total is $O(n^3 2^n)$ steps.

If we compute δ for reachable states only, we need to compute $\delta_D(S, a)$ only s times, where s is the number of reachable states. Grand total is $O(n^3 s)$ steps.

From DFA to NFA

All we need to do is to put set brackets around the states. Total $O(n)$ steps.

From FA to regex

We need to compute n^3 entries of size up to 4^n. Total is $O(n^3 4^n)$.

The FA is allowed to be a NFA. If we first wanted to convert the NFA to a DFA, the total time would be doubly exponential

From regex to FA's We can build an expression tree for the regex in n steps.

We can construct the automaton in n steps.

Eliminating ϵ-transitions takes $O(n^3)$ steps.

If you want a DFA, you might need an exponential number of steps.

Testing emptiness

$L(A) \neq \emptyset$ for FA A if and only if a final state is reachable from the start state in A. Total $O(n^2)$ steps.

Alternatively, we can inspect a regex E and tell if $L(E) = \emptyset$. We use the following method:

$E = F + G$. Now $L(E)$ is empty if and only if both $L(F)$ and $L(G)$ are empty.

$E = F.G$. Now $L(E)$ is empty if and only if either $L(F)$ or $L(G)$ is empty.

$E = F^*$. Now $L(E)$ is never empty, since $\epsilon \in L(E)$.

$E = \epsilon$. Now $L(E)$ is not empty.

$E = a$. Now $L(E)$ is not empty.

$E = \emptyset$. Now $L(E)$ is empty.

Testing membership

To test $w \in L(A)$ for DFA A, simulate A on w.
If $|w| = n$, this takes $O(n)$ steps.

If A is an NFA and has s states, simulating A
on w takes $O(ns^2)$ steps.

If A is an ϵ-NFA and has s states, simulating
A on w takes $O(ns^3)$ steps.

If $L = L(E)$, for regex E of length s, we first
convert E to an ϵ-NFA with $2s$ states. Then we
simulate w on this machine, in $O(ns^3)$ steps.

Equivalence and Minimization of Automata

Let $A = (Q, \Sigma, \delta, q_0, F)$ be a DFA, and $\{p, q\} \subseteq Q$. We define

$$p \equiv q \iff \forall w \in \Sigma^* : \hat{\delta}(p, w) \in F \text{ iff } \hat{\delta}(q, w) \in F$$

- If $p \equiv q$ we say that p and q are *equivalent*

- If $p \not\equiv q$ we say that p and q are *distinguishable*

IOW (in other words) p and q are distinguishable iff

$\exists w : \hat{\delta}(p, w) \in F$ and $\hat{\delta}(q, w) \notin F$, or vice versa

Example:

$\hat{\delta}(C, \epsilon) \in F, \hat{\delta}(G, \epsilon) \notin F \Rightarrow C \not\equiv G$

$\hat{\delta}(A, 01) = C \in F, \hat{\delta}(G, 01) = E \notin F \Rightarrow A \not\equiv G$

119

What about A and E?

$\widehat{\delta}(A, \epsilon) = A \notin F, \widehat{\delta}(E, \epsilon) = E \notin F$

$\widehat{\delta}(A, 1) = F = \widehat{\delta}(E, 1)$

Therefore $\widehat{\delta}(A, 1x) = \widehat{\delta}(E, 1x) = \widehat{\delta}(F, x)$

$\widehat{\delta}(A, 00) = G = \widehat{\delta}(E, 00)$

$\widehat{\delta}(A, 01) = C = \widehat{\delta}(E, 01)$

Conclusion: $A \equiv E$.

We can compute distinguishable pairs with the
following inductive *table filling algorithm*:

Basis: If $p \in F$ and $q \notin F$, then $p \not\equiv q$.

Induction: If $\exists a \in \Sigma : \delta(p, a) \not\equiv \delta(q, a)$,
then $p \not\equiv q$.

Example: Applying the table filling algo to A:

	A	B	C	D	E	F	G
B	x						
C	x	x					
D	x	x	x				
E		x	x	x			
F	x	x	x		x		
G	x	x	x	x	x	x	
H	x		x	x	x	x	x

Theorem 4.20: If p and q are not distinguished by the TF-algo, then $p \equiv q$.

Proof: Suppose to the contrary that that there is a *bad pair* $\{p, q\}$, s.t.

1. $\exists w : \hat{\delta}(p, w) \in F, \hat{\delta}(q, w) \notin F$, or vice versa.

2. The TF-algo does not distinguish between p and q.

Let $w = a_1 a_2 \cdots a_n$ be the shortest string that identifies a bad pair $\{p, q\}$.

Now $w \neq \epsilon$ since otherwise the TF-algo would in the basis distinguish p from q. Thus $n \geq 1$.

Consider states $r = \delta(p, a_1)$ and $s = \delta(q, a_1)$. Now $\{r, s\}$ cannot be a bad pair since $\{r, s\}$ would be indentified by a string shorter than w. Therefore, the TF-algo must have discovered that r and s are distinguishable.

But then the TF-algo would distinguish p from q in the inductive part.
Thus there are no bad pairs and the theorem is true.

Testing Equivalence of Regular Languages

Let L and M be reg langs (each given in some form).

To test if $L = M$

1. Convert both L and M to DFA's.

2. Imagine the DFA that is the union of the two DFA's (never mind there are two start states)

3. If TF-algo says that the two start states are distinguishable, then $L \neq M$, otherwise $L = M$.

Example:

We can "see" that both DFA accept
$L(\epsilon + (0 + 1)^*0)$. The result of the TF-algo is

	A	B	C	D
B	x			
C		x		
D		x		
E	x		x	x

Therefore the two automata are equivalent.

Minimization of DFA's

We can use the TF-algo to minimize a DFA by merging all equivalent states. IOW, replace each state p by $p/_\equiv$.

Example: The DFA on slide 119 has equivalence classes $\{\{A, E\}, \{B, H\}, \{C\}, \{D, F\}, \{G\}\}$.

The "union" DFA on slide 125 has equivalence classes $\{\{A, C, D\}, \{B, E\}\}$.

Note: In order for $p/_\equiv$ to be an *equivalence class*, the relation $\equiv$ has to be an *equivalence relation* (reflexive, symmetric, and transitive).

Theorem 4.23: If $p \equiv q$ and $q \equiv r$, then $p \equiv r$.

Proof: Suppose to the contrary that $p \not\equiv r$. Then $\exists w$ such that $\hat{\delta}(p, w) \in F$ and $\hat{\delta}(r, w) \notin F$, or vice versa.

OTH, $\hat{\delta}(q, w)$ is either accpeting or not.

Case 1: $\hat{\delta}(q, w)$ is accepting. Then $q \not\equiv r$.

Case 1: $\hat{\delta}(q, w)$ is not accepting. Then $p \not\equiv q$.

The vice versa case is proved symmetrically

Therefore it must be that $p \equiv r$.

To minimize a DFA $A = (Q, \Sigma, \delta, q_0, F)$ construct a DFA $B = (Q/_\equiv, \Sigma, \gamma, q_0/_\equiv, F/_\equiv)$, where
$$\gamma(p/_\equiv, a) = \delta(p, a)/_\equiv$$

In order for B to be well defined we have to show that

$$\text{If } p \equiv q \text{ then } \delta(p, a) \equiv \delta(q, a)$$

If $\delta(p, a) \not\equiv \delta(q, a)$, then the TF-algo would conclude $p \not\equiv q$, so B is indeed well defined. Note also that $F/_\equiv$ contains all and only the accepting states of A.
Example: We can minimize

to obtain

129

NOTE: We cannot apply the TF-algo to NFA's.

For example, to minimize

we simply remove state C.

However, $A \not\equiv C$.

Let B be the minimized DFA obtained by applying the TF-algo to DFA A.

We already know that $L(A) = L(B)$.

What if there existed a DFA C, with $L(C) = L(B)$ and fewer states than B?

Then run the TF-algo on B "union" C.

Since $L(B) = L(C)$ we have $q_0^B \equiv q_0^C$.

Also, $\delta(q_0^B, a) \equiv \delta(q_0^C, a)$, for any a.

Claim: For each state p in B there is at least one state q in C, s.t. $p \equiv q$.

Proof of claim: There are no inaccessible states, so $p = \hat{\delta}(q_0^B, a_1 a_2 \cdots a_k)$, for some string $a_1 a_2 \cdots a_k$. Now $q = \hat{\delta}(q_0^C, a_1 a_2 \cdots a_k)$, and $p \equiv q$.

Since C has fewer states than B, there must be two states r and s of B such that $r \equiv t \equiv s$, for some state t of C. But then $r \equiv s$ (why?) which is a contradiction, since B was constructed by the TF-algo.
